

ABSTRACT OF THE DISCLOSURE

A system for selling goods a purchaser desired to purchase via a network. This system has: a table in which units of a variety of goods according to the number of goods and ranges to which the units are applied are stored; a section detecting the number of goods to be purchased on the basis of an identification code of one or more goods received from the purchaser; a section reading at least one unit applied to the goods to be purchased from the table on the basis of the detected number of goods; and a section of calculating the number of goods belonging to the range to which the read at least one unit is applied and calculating a purchase price by using the read unit and the calculated number of goods.
